

MIT launches the first robot that can do a backflip

Pubblicato: Giovedì 7 Marzo 2019

Of course, it is no toy, even though MIT's press office has **uploaded a video to YouTube**, showing all of these circus antics. The point is that the **mini-cheetah**, which is its name, is **the first robot capable of making such moves**.

Not only: **it can also get up again**, if its back is pushed to the ground. And it can be scaled: like Lego, you can add as many legs as you want. And it is easy to repair: each leg is moved by three small electric motors. If one of them breaks, it can be removed and replaced.
